Industrial Internship Report

On

"IoT Based Smart Monitoring System"

Prepared by

Soumeel Mallick

Domain: Internet of Things (IoT)

Date of Submission: 16 March 2026

Executive Summary

This report presents the work completed during a six-week Industrial Internship conducted through upSkill Campus in collaboration with UniConverge Technologies Pvt Ltd (UCT). The internship aimed to provide practical exposure to emerging technologies such as Internet of Things (IoT), Cloud Computing, Cyber Security and Data Science.

The project undertaken during this internship was titled 'IoT Based Smart Monitoring System'. The objective of this project was to demonstrate how IoT devices can collect real-time data from sensors and transmit that data to a cloud platform for monitoring and analysis.

The system architecture consists of sensors, a microcontroller device, internet connectivity and a cloud dashboard. Collected sensor data is transmitted to the cloud where it can be visualized and analyzed. This approach helps industries and smart environments monitor conditions efficiently.

Through this internship, I gained knowledge of IoT architecture, sensor integration, cloud communication and industrial monitoring systems. The internship helped improve my technical understanding and problem-solving skills.

1 Preface

This report summarizes the work and learning experience gained during the six-week industrial internship with UniConverge Technologies through upSkill Campus.

The purpose of this internship was to provide practical exposure to industry-oriented technologies and understand how modern digital solutions are developed for real-world applications.

During the internship I explored Internet of Things concepts, cloud integration and smart monitoring systems. The internship helped me gain valuable knowledge about emerging technologies used in digital transformation.

I would like to express my sincere gratitude to UniConverge Technologies and upSkill Campus for providing this opportunity to enhance my technical knowledge and industry understanding.

2 Introduction

The Internet of Things (IoT) is a technology that connects physical devices, sensors and systems through the internet to collect and exchange data. IoT is widely used in industries for automation, monitoring and predictive maintenance.

This internship helped in understanding how IoT technologies are applied in industrial environments and how connected systems can improve operational efficiency.

2.1 About UniConverge Technologies Pvt Ltd

UniConverge Technologies Pvt Ltd (UCT) is a technology company established in 2013 and working in the Digital Transformation domain. The company develops industrial solutions using technologies such as Internet of Things, Cloud Computing, Cyber Security and Machine Learning.

2.2 About upSkill Campus

upSkill Campus is a career development platform that provides training programs, internships and industry exposure to students. The platform focuses on building job-ready skills through real-world projects and mentorship.

2.3 Objective

The main objective of this internship was to gain practical knowledge about IoT technologies, understand real-world problem solving approaches and improve technical and analytical skills.

2.4 Reference

1. https://www.uniconvergetech.in

2. https://www.upskillcampus.com

3. IoT documentation and online learning resources

2.5 Glossary

IoT – Internet of Things

Cloud – Online data storage and computing platform

Sensor – Device used to detect and measure environmental conditions

3 Problem Statement

The objective of this project is to design an IoT based smart monitoring system that collects real-time data from sensors and sends it to a cloud platform for monitoring and analysis.

The system demonstrates how connected devices can monitor environmental conditions and improve automation and decision-making processes.

4 Existing and Proposed Solution

Traditional monitoring systems rely on manual observation and often lack real-time monitoring capabilities.

The proposed IoT-based monitoring system automates data collection using sensors and transmits the data to a cloud platform for real-time monitoring and analysis.

5 Proposed Design / Model

The system consists of sensors connected to a microcontroller device which collects environmental data. The data is transmitted through internet connectivity to a cloud platform where it can be visualized through dashboards.

High Level Workflow:

Sensor → Microcontroller → Internet → Cloud Platform → User Dashboard

6 Performance Test

The performance of the monitoring system was evaluated based on reliability of data transmission and system response.

6.1 Test Plan / Test Cases

Test cases were designed to verify sensor data collection, communication reliability and system response time.

6.2 Test Procedure

The system was tested by generating sample sensor data and verifying whether the data was correctly transmitted to the cloud platform.

6.3 Performance Outcome

The monitoring system successfully transmitted data and demonstrated reliable communication between sensors and the cloud platform.

7 My Learnings

During this internship I gained knowledge about IoT architecture, cloud integration and industrial monitoring solutions. I also improved my understanding of programming and connected device communication.

8 Future Work Scope

In the future this system can be enhanced by integrating more sensors, advanced analytics and machine learning algorithms for predictive monitoring.
